Section 2：Application Test

## 数学検定 <br> PROFICIENCY TEST <br> IN PRACTICAL MATHEMATICS

## Test Time ： 120 minutes

## Test Instructions

1．Make sure that you have the correct level（Kyu）test．
2 ．Do not open the booklet until you are told to do so．
3 ．Write your examinee number and name on this page．
4．Write your name，examinee number and other necessary information on the answer sheets．
5．Write your answers on the answer sheets（they are numbered 1 through 4）．Write the steps leading to your answer．However if there are specific instructions for a problem，follow the instructions．
6．Problems 1 to 5 are selective problems．Choose two problems from the selective problems and fill in 0 to indicate which problems you chose．Then write your answers．Note that all of your answers will not be marked if you answered more than two problems from the selective problems．Problems 6 and 7 are required problems．
7．You may use a calculator．
8．Turn off your cell phone and do not use it during the test．
9．Ask an examination supervisor if your problem sheets have inconsistent page numbering or missing pages．
10．It is prohibited to disclose the problems to the general public，such as on the Internet，without permission．

| Examinee <br> Number | - | Name |  |
| :---: | :---: | :---: | :--- |

※Your personal information will be handled appropriately according to the＂Handling of Personal Information＂agreement that was approved at the time of registration．

## [1st Kyu]

## Section 2: Application Test

## 1 (Selective)

For a positive integer $n$, let $\varphi(n)$ be the number of positive integers less than or equal to $n$ that are relatively prime to $n$.
(1) Find the value of $\varphi(2021)$. Write only your answer.
(2) Among positive integers $x$ that satisfy the congruence

$$
x^{2273} \equiv 5(\bmod 2021),
$$

there is only one value of $x$ that is less than or equal to 2021 (you don't need to prove this). Find the integer. You may use the following facts without proving them.

- If two positive numbers $a$ and $m$ are relatively prime, then

$$
a^{\varphi(m)} \equiv 1(\bmod m) .
$$

- The following congruences hold:

$$
\begin{aligned}
& 5^{5} \equiv 1104(\bmod 2021), \\
& 5^{6} \equiv 1478(\bmod 2021), \\
& 5^{7} \equiv 1327(\bmod 2021), \\
& 5^{8} \equiv 572(\bmod 2021), \\
& 5^{9} \equiv 839(\bmod 2021), \\
& 5^{10} \equiv 153(\bmod 2021) .
\end{aligned}
$$

2 (Selective)
The function defined by

$$
\Gamma(t)=\int_{0}^{\infty} x^{t-1} e^{-x} d x
$$

is called the gamma function, where $t$ is a positive real number and $e$ is the base of the natural logarithm. You many use the following facts without proving.
$\lim _{x \rightarrow \infty} x^{a} e^{-x}=0(a$ is a real number $)$ and $\int_{0}^{\infty} e^{-x^{2}} d x=\frac{\sqrt{\pi}}{2}$.
(1) Prove the following (1) and (2).
(1) $\quad \Gamma(t+1)=t \Gamma(t)$
(2) $\quad \Gamma(n+1)=n$ ! for a positive integer $n$
(2) Calculate the following improper integral.

$$
\int_{0}^{1} t^{3}\left(\log _{e} \frac{1}{t}\right)^{\frac{5}{2}} d t
$$

## 3 (Selective)

In $\triangle \mathrm{ABC}$, let $\mathrm{BC}=a, \mathrm{CA}=b, \mathrm{AB}=c, \angle \mathrm{CAB}=A, \angle \mathrm{ABC}=B$ and $\angle \mathrm{BCA}=C$. If $a+b+c=3$, find the minimum value of

$$
T=\frac{a^{2}}{3+2 \sqrt{3} \sin A}+\frac{b^{2}}{3+2 \sqrt{3} \sin B}+\frac{c^{2}}{3+2 \sqrt{3} \sin C} .
$$

## 4 (Selective)

Three people, A, B and C bowled. Person A played 100 frames, person B played 120 frames and person C played 80 frames. The table shows the number of strikes (all ten pins are knocked down on the first roll), the number of spares (the last of the ten pins is/are knocked down on the second roll of a frame) and the number of the other results for each person.

|  | A | B | C | Total |
| :---: | :---: | :---: | :---: | :---: |
| Strike | 27 | 45 | 18 | 90 |
| Spare | 18 | 18 | 24 | 60 |
| Other | 55 | 57 | 38 | 150 |
| Total | 100 | 120 | 80 | 300 |

Can it be concluded that there is no difference in the proportions of the numbers of strikes, spares and the others for the three people? Conduct the hypothesis test at the significance level 0.05 under
the null hypothesis $H_{0}$ : there is no difference among the three people,
the alternative hypothesis $H_{1}$ : there is a difference among the three people.
Use the values in the $\chi^{2}$-distribution table given.

## 5 (Selective)

Let $\mathbf{N}$ be a set of positive integers. A mapping, denoted by $n=f(m)$, from $\mathbf{N}$ to $\mathbf{N}$ is defined as follows:

For an integer $k$,
( I ) If $m$ is even, that is $m=2 k, n=f(m)=3 k$.
( II) If $m$ is odd and is in the form $m=4 k+1, n=f(m)=3 k+1$.
(III) If $m$ is odd and is in the form $m=4 k+3, n=f(m)=3 k+2$.

Answer the following.
(1) Verify that the mapping $f$ is bijective from $\mathbf{N}$ to $\mathbf{N}$ and express the inverse mapping, denoted by $m=f^{-1}(n)$, of $n=f(m)$ in the form shown above.
(2) Letting $m_{0}$ be an initial value, form the sequence

$$
m_{0}, \quad m_{1}, \quad m_{2}, \ldots
$$

by

$$
m_{j+1}=f\left(m_{j}\right) .
$$

Sometimes, depending on the value of $m_{0}$, we have

$$
m_{\ell}=m_{0}, \text { where } \ell \text { is a positive integer. }
$$

Here, we call the minimum positive integer $\ell$ such that $m_{\ell}=m_{0}$ the period for the initial value $m_{0}$.

For example, if $m_{0}=1$, we have $m_{1}=1, m_{2}=1, \ldots$, then the period for the initial value 1 is 1 .
Among initial values $m_{0}(\neq 1)$ with a period less than or equal to 30 , give three numbers of different periods and find their periods for the initial values. Write only your answer.

6 (Required)
Let $n$ be a positive integer and let $I$ be the $3 \times 3$ unit matrix. For the $3 \times 3$ square matrix

$$
A=\left(\begin{array}{ccc}
-3 & -3 & -5 \\
3 & 3 & 7 \\
1 & 1 & 1
\end{array}\right)
$$

$A^{n}$ is expressed as

$$
A^{n}=p_{n} A^{2}+q_{n} A+r_{n} I,
$$

where $p_{n}, q_{n}$ and $r_{n}$ are real numbers. Find $p_{n}, q_{n}$ and $r_{n}$.

7 (Required)
Find the solution of the following differential equation under the initial conditions $y(0)=-4$ and $y^{\prime}(0)=12$, and express it in the form $y=f(x)$.

$$
y^{\prime \prime}+6 y^{\prime}+5 y=26 \cos x+25 x
$$

The $\chi^{2}$-Distribution Table (values of $\alpha$ with $n$ degrees of freedom)

The $\chi^{2}$-Distribution Table
